

# PORTACOOOL®

## APEX SERIES

### What is Media Drying?

Media Drying is a feature integrated into Portacool's Apex Lineup that enhances the longevity of the cooling media and prevents the growth of mildew or the build-up of contaminants within the media. Its primary function is to automatically shut off water operation and continue running the fan to dry the media after use, ensuring optimal performance and prolonging the life of the media.

### How it Works

When you use the power button to shut down your Portacool cooler, Media Drying mode automatically initiates, shutting off the flow of water and activating the fan to dry the media. During this time, the fan operates at optimized settings to facilitate thorough drying while minimizing airflow. The display will indicate that Media Drying mode is active, and inform you of how much time remains before the media is dry.

### Skipping Media Drying

While Media Drying mode automatically activates when shutting down the cooler, you have the option to dismiss it if desired. To skip Media Drying, simply press the power button while Media Drying is active to shutdown the cooler. Keep in mind that drying the media after each use prolongs the life of the media and helps you maintain cooling performance.
